

INTRO TO INVESTMENT RESEARCH

CONTENTS

- 01 THE EVOLUTION OF INVESTMENT RESEARCH
- 02 WHERE ALPHA COMES FROM
- 03 READING LIST & TO DO

02

Challenge what you believe about markets — then find out who already tested it, and what they found.

WHERE WE LEFT OFF.

Three things were due for this session. The third one is the reason it exists.

01

THE DATASET

Five tickers, ten years of daily data, curated by you.

`Output/*.csv`

02

THE REPO

Pushed to your own GitHub, config included, so the run is reproducible.

`github.com/you`

03

ONE BELIEF

One paragraph on something you think is true about markets.

NOW WE TEST IT

THIS SESSION

CHALLENGE WHAT YOU BELIEVE ABOUT MARKETS.

Every belief you hold has already been
written down, tested and argued with.
Research starts by finding out by whom.

THE EVOLUTION OF INVESTMENT RESEARCH

Six acts · Prices → Value & risk → Efficiency → Anomalies → Discipline → Engineering

SIX ACTS.

Each act asks the question the one before could not answer
— dated by the works that forced it.

ACT I PRICES Can prices be predicted? Prices look random; forecasters look like noise.	THE WORKS 1900 · Bachelier 1933 · Cowles
ACT II VALUE & RISK What is it worth, how much to hold? Value is a model. Risk is priced.	THE WORKS 1934 · Graham & Dodd 1952 · Markowitz 1964 · Sharpe
ACT III EFFICIENCY Does anyone beat the market? Proof is on you — and research is what efficiency pays for.	THE WORKS 1968 · Jensen 1970 · Fama 1976 · Ross 1980 · Grossman & Stiglitz
ACT IV ANOMALIES Why does the data misbehave? Returns have structure. Mispricing has a mechanism.	THE WORKS 1993 · Fama & French 1993 · Jegadeesh & Titman 1979 · Kahneman & Tversky 1997 · Shleifer & Vishny
ACT V DISCIPLINE Do edges last? Edges decay and the bar rises.	THE WORKS 2004 · Lo 2013 · Asness, Moskowitz & Pedersen 2016 · Harvey, Liu & Zhu
ACT VI ENGINEERING How does an idea become a book? Alpha is residualized, scaled and learned.	THE WORKS 1995 · Grinold & Kahn 2021 · Paleologo 2020 · Gu, Kelly & Xiu 2022 · Guo, Wang, Ni & Shum

ACT I PRICES

Can prices be
predicted at all?

1900 Bachelier 1933 Cowles

ACT I · PRICES

DOW, BACHELIER & NELSON

Markets as signals.

THE WORK THAT CHANGED IT

1900

Théorie de la Spéculation
Bachelier

WHY IT MATTERS

Treated markets as an information system before formal theory existed.

KEY WORK

- 1889 Dow — Wall Street Journal editorials
- 1900 Bachelier — Théorie de la Spéculation
- 1903 Nelson — The ABC of Stock Speculation

CORE IDEAS

- Prices embed collective information
- Trends reflect human behavior
- Uncertainty can be modeled probabilistically

“The market is a barometer of all conditions.”

WHERE THE EDGE IS

If prices carry information, so does their sequence. Trend, reversal and volatility clustering all start here.

**If prices carry
information... can
anyone read it better
than the crowd?**

ACT I · PRICES

COWLES, KENDALL & SAMUELSON

The first scoreboard.

THE WORK THAT CHANGED IT

1933

Can Stock Market Forecasters Forecast?

Cowles

WHY IT MATTERS

Put forecasters, Dow Theory and the price series themselves to a statistical test — and found little that beat chance. The random walk acquired evidence, then a proof.

KEY WORK

- 1933 Cowles — Can Stock Market Forecasters Forecast?
- 1953 Kendall — The Analysis of Economic Time-Series, Part I: Prices
- 1965 Samuelson — Proof That Properly Anticipated Prices Fluctuate Randomly

CORE IDEAS

- Track the call against the market, not against the story
- Price changes look random — a fact before it was a theory
- Properly anticipated prices must fluctuate randomly

“Put to the test, the forecasters were noise.”

WHERE THE EDGE IS

Before you look for an edge, build the scoreboard. A strategy that is not measured against a passive alternative has not been tested at all.

ACT II VALUE & RISK

If prices wander... what is a security actually worth, and how much of it should you hold?

1934 Graham & Dodd 1952 Markowitz 1964 Sharpe

ACT II · VALUE & RISK

GRAHAM, DODD & DAMODARAN

Intrinsic value.

THE WORK THAT CHANGED IT

1934

Security Analysis

Graham & Dodd

WHY IT MATTERS

Turned investing from price-watching into a research discipline built on value and explicit assumptions. Williams gave value a formula — and Markowitz started from it.

KEY WORK

- 1934 Graham & Dodd — Security Analysis
- 1938 Williams — The Theory of Investment Value
- 1994 Damodaran — Investment Valuation

CORE IDEAS

- Value exists independently of price
- Valuation is a model, not a number
- Assumptions have to be written down

“Valuation is a bridge between stories and numbers.”

WHERE THE EDGE IS

The gap between a story and a number is a hypothesis. Mispricing against intrinsic value is the oldest edge there is.

**If value exists.... how
do we allocate capital
across many bets?**

ACT II · VALUE & RISK

MARKOWITZ

Risk comes first.

THE WORK THAT CHANGED IT

1952

Portfolio Selection

Markowitz

WHY IT MATTERS

Formalized portfolio construction as a mathematical research problem.

KEY WORK

1952 Portfolio Selection

1959 Portfolio Selection: Efficient Diversification of Investments

CORE IDEAS

- Diversification is measurable
- Risk lives in covariance
- Portfolios beat individual assets

“Investment research starts with how you allocate capital.”

WHERE THE EDGE IS

Edge lives in how you combine bets, not only in which ones you pick. Correlation is a return you can engineer.

**If risk can be
measured... which risk
deserves a reward?**

ACT II · VALUE & RISK

SHARPE & LINTNER

Pricing the risk.

THE WORK THAT CHANGED IT

1964

Capital Asset Prices

Sharpe

WHY IT MATTERS

Separated market compensation from research skill. Treynor and Mossin reached the same result independently.

KEY WORK

1964 Sharpe — Capital Asset Prices

1965 Lintner — The Valuation of Risk Assets

CORE IDEAS

- Beta earns a premium
- Performance attribution is born

“Not all risk is rewarded.”

WHERE THE EDGE IS

Before you call it alpha, ask whether it is beta in disguise. Strip market exposure first — most “edges” vanish.

ACT III EFFICIENCY

Does anyone actually beat the market — and if not, why would anyone try?

1968 Jensen 1970 Fama 1976 Ross 1980 Grossman & Stiglitz

ACT III · EFFICIENCY

JENSEN

Measuring skill.

THE WORK THAT CHANGED IT

1968

The Performance of Mutual Funds in the Period 1945–1964

Jensen

WHY IT MATTERS

Turned alpha from intuition into a measurable residual.

KEY WORK

1968 The Performance of Mutual Funds in the Period 1945–1964

CORE IDEAS

- Alpha is performance after adjusting for risk
- Most active managers fail to generate persistent alpha
- Measurement precedes belief

“Investment research became a test, not a story.”

WHERE THE EDGE IS

Set the bar before you look: the idea must beat a risk-adjusted benchmark, not zero. Measure, then believe.

**If alpha is rare and fragile,
should it be assumed
— or must it be proven?**

ACT III · EFFICIENCY

FAMA

Markets as a discipline.

THE WORK THAT CHANGED IT

1970

Efficient Capital Markets

Fama

WHY IT MATTERS

Forced investment research to start from skepticism, not belief.

KEY WORK

1970 Efficient Capital Markets: A Review of Theory and Empirical Work

1991 Efficient Capital Markets: II

CORE IDEAS

- Prices reflect available information
- Alpha is rare
- Evidence beats intuition

“Alpha must be proven — not assumed.”

WHERE THE EDGE IS

Assume the price already knows. Your idea must name the information it has not absorbed — or the reason it cannot.

If one beta cannot explain returns... how many risks are we being paid to carry?

ACT III · EFFICIENCY

ROSS

Risk is multi-dimensional.

THE WORK THAT CHANGED IT

1976

The Arbitrage Theory of Capital Asset Pricing
Ross

WHY IT MATTERS

Showed that returns must be driven by several independent sources of risk — even when we cannot yet name them.

KEY WORK

1976 The Arbitrage Theory of Capital Asset Pricing

CORE IDEAS

- No-arbitrage
- Multiple risk factors
- Theory before measurement

“Risk premia exist even when factors are unknown.”

WHERE THE EDGE IS

Unnamed risk premia are candidate strategies. Find a risk others refuse to hold and get paid for holding it.

If nobody beats the market... why does anyone still pay for research?

ACT III · EFFICIENCY

GROSSMAN & STIGLITZ

The paradox that pays for research.

THE WORK THAT CHANGED IT

1980

On the Impossibility of Informationally Efficient Markets

Grossman & Stiglitz

WHY IT MATTERS

If prices reflected all information, nobody would be paid to gather it — so nobody would. Prices must stay imperfect enough to reward the research that improves them.

KEY WORK

1980 Grossman & Stiglitz — On the Impossibility of Informationally Efficient Markets

2015 Pedersen — Efficiently Inefficient

CORE IDEAS

- Information is costly; someone has to be paid to collect it
- Perfect efficiency is self-defeating
- Alpha is the wage of research — and the wage is competitive

“Efficient enough to be hard. Inefficient enough to be worth it.”

WHERE THE EDGE IS

Your edge is the wage for information others found too expensive to gather. Ask what it costs to know this — and why the crowd will not pay it.

ACT IV ANOMALIES

If markets are efficient... why does the evidence refuse to behave?

1993 Fama & French

1993 Jegadeesh & Titman

1979 Kahneman & Tversky

1997 Shleifer & Vishny

ACT IV · ANOMALIES

FAMA, FRENCH & CARHART

Empirical reality.

THE WORK THAT CHANGED IT

1993

Common Risk Factors in Stocks and Bonds
Fama & French

WHY IT MATTERS

Showed that returns have structure, even in efficient markets.

KEY WORK

- 1992

Fama & French — The Cross-Section of Expected Stock Returns
- 1993

Fama & French — Common Risk Factors in Stocks and Bonds
- 1997

Carhart — On Persistence in Mutual Fund Performance

CORE IDEAS

- Value, size, momentum
- Factor investing becomes scalable
- Research becomes systematic

“Markets are mostly efficient — but not simple.”

WHERE THE EDGE IS

Known factors are the hurdle, not the idea. A new edge must survive after value, size and momentum are stripped out.

**If returns have structure...
which patterns survive
the cost of trading them?**

ACT IV · ANOMALIES

JEGADEESH & TITMAN · AMIHUD

Momentum meets liquidity.

THE WORK THAT CHANGED IT

1993

Returns to Buying Winners and Selling Losers

Jegadeesh & Titman

WHY IT MATTERS

Documented the anomaly that resists a risk explanation best — and priced the friction that decides who can actually trade it.

KEY WORK

- 1993

Jegadeesh & Titman — Returns to Buying Winners and Selling Losers
- 2002

Amihud — Illiquidity and Stock Returns: Cross-Section and Time-Series Effects

CORE IDEAS

- Past winners keep winning for three to twelve months
- Illiquidity is priced — and it is a cost you pay
- An anomaly is only as real as the trade that captures it

“The anomaly is free. The trade is not.”

WHERE THE EDGE IS

Friction is edge. Illiquidity is priced, and the capacity to trade it decides who actually collects.

**If the anomalies are
real... who keeps
making the mistake?**

ACT IV · ANOMALIES

KAHNEMAN, TVERSKY, THALER & SHILLER

Human behavior.

THE WORK THAT CHANGED IT

1979

Prospect Theory
Kahneman & Tversky

WHY IT MATTERS

Explained why inefficiencies survive — a direct challenge to rationality. Thaler took the biases to the data; Shiller showed prices move more than fundamentals can justify.

KEY WORK

- 1979 Kahneman & Tversky — Prospect Theory
- 1981 Shiller — Do Stock Prices Move Too Much?
- 1985 De Bondt & Thaler — Does the Stock Market Overreact?

CORE IDEAS

- Loss aversion and asymmetric risk preferences
- Overreaction shows up in prices — losers become winners
- Volatility exceeds what fundamentals can justify

“Risk is felt, not calculated.”

WHERE THE EDGE IS

Systematic human error is the most durable mispricing. Ask which bias makes the counterparty sell to you — and keep doing it.

**If mistakes are
obvious.... why
do they survive?**

ACT IV · ANOMALIES

SHLEIFER & VISHNY

Limits to arbitrage.

THE WORK THAT CHANGED IT

1997

The Limits of Arbitrage

Shleifer & Vishny

WHY IT MATTERS

Explain why being right is not enough: arbitrage is risky, costly and constrained. The same authors argued the value premium is a mistake, not a risk.

KEY WORK

- 1994

Lakonishok, Shleifer & Vishny — Contrarian Investment, Extrapolation, and Risk
- 1997

Shleifer & Vishny — The Limits of Arbitrage

CORE IDEAS

- Capital constraints and career risk
- The value premium as extrapolation error
- Anomalies persist where the arbitrageur cannot act

“Markets are stories with prices attached.”

WHERE THE EDGE IS

Ask who cannot take the other side — constrained capital, career risk, forced sellers. Anomalies persist where they live.

ACT V DISCIPLINE

**So markets are rational...
and emotional. What survives
both — and for how long?**

2004 Lo 2013 Asness, Moskowitz & Pedersen 2016 Harvey, Liu & Zhu

ACT V · DISCIPLINE

LO

Markets adapt.

THE WORK THAT CHANGED IT

2004

The Adaptive Markets Hypothesis

Lo

WHY IT MATTERS

Rejected the random walk on the data in 1988, then reframed markets as evolving systems — reconciling efficiency with behavior.

KEY WORK

- 1988

Lo & MacKinlay — Stock Market Prices Do Not Follow Random Walks
- 2004

Lo — The Adaptive Markets Hypothesis

CORE IDEAS

- Strategies have life cycles
- Alpha is temporary
- Regimes matter

“Efficiency is not a state — it is a process.”

WHERE THE EDGE IS

Every edge decays. Build in the signal that tells you the regime has changed — and be ready to retire the strategy.

**If alpha decays...
what does durable
research look like?**

ACT V · DISCIPLINE

ASNESS

Research discipline in practice.

THE WORK THAT CHANGED IT

2013

Value and Momentum Everywhere

Asness, Moskowitz & Pedersen

WHY IT MATTERS

Proved that research survives markets through discipline.

KEY WORK

1997 The Interaction of Value and Momentum Strategies

2013 Asness, Moskowitz & Pedersen — Value and Momentum Everywhere

CORE IDEAS

- Factors persist but cycle
- Robustness beats intuition
- Behavioral foundations matter

“The best strategies do not look smart — they look resilient.”

WHERE THE EDGE IS

Combine premia that fail at different times. Robustness across markets beats a perfect fit in one.

**If robustness beats intuition...
how many backtests
did it take to find yours?**

ACT V · DISCIPLINE

HARVEY, LIU & ZHU · MCLEAN & PONTIFF

The bar rises.

THE WORK THAT CHANGED IT

2016

... and the Cross-Section of Expected Returns

Harvey, Liu & Zhu

WHY IT MATTERS

Showed that after decades of searching the hurdle for a discovery must rise — and that anomalies shrink once published, because the market reads the papers too.

KEY WORK

2016 Harvey, Liu & Zhu — ... and the Cross-Section of Expected Returns

2016 McLean & Pontiff — Does Academic Research Destroy Stock Return Predictability?

2019 Arnott, Harvey & Markowitz — A Backtesting Protocol

CORE IDEAS

- Hundreds of published factors, most of them noise
- A t-statistic of 2 is no longer evidence — aim for 3
- Anomaly returns roughly halve after publication

“The more you searched, the less your result means.”

WHERE THE EDGE IS

Count your trials. An idea has to be justified before the backtest — the backtest can only fail to reject it.

ACT VI ENGINEERING

**If an edge is real... how does
it become a portfolio — and
what can a machine add?**

ACT VI · ENGINEERING

ROSENBERG · GRINOLD & KAHN

From theory to the desk.

THE WORK THAT CHANGED IT

1995

Active Portfolio Management
Grinold & Kahn

WHY IT MATTERS

Rosenberg turned multi-factor risk into a working model — BARRA — and Grinold & Kahn wrote the operating manual for running active research on top of it.

KEY WORK

- 1974 Rosenberg — Extra-Market Components of Covariance in Security Returns
- 1989 Grinold — The Fundamental Law of Active Management
- 1995 Grinold & Kahn — Active Portfolio Management

CORE IDEAS

- Risk models make alpha measurable, not just theoretical
- $IR \approx IC \times \sqrt{\text{breadth}}$ — skill times independent bets
- Many small bets beat a few big calls

“Skill is worth little without breadth.”

WHERE THE EDGE IS

Edge scales with breadth. Ask how many independent bets a year your idea gives you — one call on the market is not a strategy.

**If everything has
exposure... what
is actually yours?**

ACT VI · ENGINEERING

PALEOLOGO

From ideas to portfolios.

THE WORK THAT CHANGED IT

2021

Advanced Portfolio Management

Paleologo

WHY IT MATTERS

Shows how investment research becomes real portfolios — by isolating residual alpha and enforcing risk discipline.

KEY WORK

- 2021 Advanced Portfolio Management
- 2025 The Elements of Quantitative Investing

CORE IDEAS

- Alpha must be residualized from known risk factors
- Portfolio construction matters as much as idea generation

“Alpha is what remains after risk is removed.”

WHERE THE EDGE IS

Residualize. What is left after known factors are removed is the only part anyone will pay you for.

**If clean signals are rare...
who finds them faster:
humans or machines?**

ACT VI · ENGINEERING

GU, KELLY & XIU
▪ DIXON ET AL.

Machine learning.

THE WORK THAT CHANGED IT

2020

Empirical Asset Pricing via Machine Learning

Gu, Kelly & Xiu

WHY IT MATTERS

Gu, Kelly & Xiu showed flexible models, disciplined out of sample, roughly double the predictive power of linear ones. Dixon, Halperin & Bilokon place the tools inside finance’s own tradition — not a black box.

KEY WORK

2020 Gu, Kelly & Xiu — Empirical Asset Pricing via Machine Learning

2020 Dixon, Halperin & Bilokon — Machine Learning in Finance: From Theory to Practice

2023 Kelly & Xiu — Financial Machine Learning

CORE IDEAS

- Nonlinearity and interactions carry real predictive power
- Learning replaces assumptions about the data-generating process
- Finance becomes a design problem, not only a modeling problem

“Investment research becomes a system that learns.”

WHERE THE EDGE IS

Let the model learn structure you cannot write down — but only where you can say why it should exist.

If learning systems can model perception and decision together, how should we design investment research going forward?

ACT VI · ENGINEERING

GUO, WANG, NI & SHUM

Investment systems.

THE WORK THAT CHANGED IT

2022

Quant 4.0

Guo, Wang, Ni & Shum

WHY IT MATTERS

Research is no longer about finding isolated signals — it is about designing systems that continuously learn, adapt, and combine human structure with machine scale.

KEY WORK

2022 Quant 4.0: Engineering Quantitative Investment with Automated, Explainable and Knowledge-driven AI

CORE IDEAS

- Alpha lives in representations, not raw signals
- Machines explore scale; humans impose structure
- Research is a system, not a model

“Modern investing is engineered, not discovered.”

WHERE THE EDGE IS

The durable edge is the system that keeps generating and retiring hypotheses — not any single one of them.

**INVESTMENT
RESEARCH DID
NOT EVOLVE BY
REPLACEMENT.**

**IT EVOLVED
BY ADDITION.**

HOW WE HOLD BOTH

**THE RESEARCH PROCESS
IS DISCRETIONARY
AT DESIGN AND
SYSTEMATIC AT SCALE.**

Scientific principles are what connect the
two.

WHERE ALPHA COMES FROM

Every stop on the arc names a source of edge. Five of them survive scrutiny.

FIVE SOURCES OF EDGE.

An idea without a named source of edge is a pattern. Say which of these it draws on — and why that door is still open — before you test anything.

01**RISK PREMIA**

You are paid to hold a risk others refuse to bear.

ASK

What risk am I carrying — and who is paying me for it?

Sharpe · Ross · Fama & French

02**BEHAVIORAL**

People err in the same direction, again and again.

ASK

Which bias makes the counterparty sell to me?

Kahneman & Tversky · Thaler · Shiller

03**LIMITS TO ARBITRAGE**

The people who know better cannot act on it.

ASK

Who cannot take the other side — and why not?

Shleifer & Vishny · Amihud

04**INFORMATION**

You measure something the price has not absorbed.

ASK

What do I see that the price does not — and why me?

Grossman & Stiglitz · Fama · Gu, Kelly & Xiu

05**IMPLEMENTATION**

Same signal — more of it kept after costs.

ASK

Can I capture a known edge better than the crowd does?

Markowitz · Grinold & Kahn · Paleologo

WHERE IDEAS COME FROM.

Six places to look. Each comes with the way it fools you.

01 PUBLISHED ANOMALIES

The factor zoo: hundreds of documented patterns, most with a paper behind them.

THE TRAP

Most are noise. Prefer ideas with a mechanism, replicated out of sample.

02 MARKET STRUCTURE

Index rebalances, option expiries, month-end flows, forced sellers.

THE TRAP

Crowded and small. Check capacity before you fall in love.

03 BEHAVIORAL PATTERNS

Under-reaction to news, over-reaction to stories, the disposition effect.

THE TRAP

Name the bias and who holds it — or it is a story too.

04 FRICTIONS

Illiquidity, funding constraints, short-sale limits.

THE TRAP

The premium is real. The cost of collecting it is what you are testing.

05 YOUR OWN DATA

Something you can measure that others do not — or measure better.

THE TRAP

A new dataset is a hypothesis generator, not a hypothesis.

06 COMBINING KNOWN PREMIA

Value with momentum. Trend with liquidity. Carry with trend.

THE TRAP

Diversification is edge only if the pieces fail at different times.

SEVEN QUESTIONS BEFORE ANY BACKTEST.

01	Why does this edge exist?	GROSSMAN & STIGLITZ · FAMA
02	Who is on the other side — and why do they keep losing?	KAHNEMAN & TVERSKY · SHLEIFER & VISHNY
03	Is it a risk premium or a mispricing — and which one do I want to own?	ROSS · FAMA & FRENCH
04	How many independent bets a year does it give me?	GRINOLD & KAHN
05	Does it survive costs, and how much capital can it hold?	AMIHUD · PALEOLOGO
06	When does it fail — and would I hold it through that?	LO · SHILLER
07	How many ideas did I try before this one?	HARVEY, LIU & ZHU · MCLEAN & PONTIFF

If the seven answers do not fit in one paragraph, it is not a hypothesis yet.

WHAT A GOOD IDEA LOOKS LIKE.

A belief is a sentence. A hypothesis names its edge, its counterparty, its test — and what would make you drop it.

THE CLAIM

One sentence, present tense, about a measurable relationship.

Liquid assets in an uptrend keep outperforming for weeks, not days.

THE SOURCE OF EDGE

Which of the five it draws on — and why that door should still be open.

Behavioral under-reaction, collected with an implementation edge.

THE OTHER SIDE

Who sells to you, and what keeps them doing it.

Cap-weighted holders who rebalance on size, not on trend.

THE TEST

The measurement that settles it, chosen before you look.

Rank by trend, weight by liquidity, hold one month, net of costs.

THE KILL SWITCH

The result that makes you abandon the idea instead of tuning it.

No edge after costs in two of three sub-periods.

WHICH ONE WOULD YOU ARGUE WITH?

Whose paper does your belief contradict — and are you comfortable with that?

If alpha decays, what is the shelf life of the strategy you want to build?

What evidence would actually change your mind before you spend four months on it?

UP NEXT

NEXT: DATA CURATION & FEATURE ENGINEERING.

Session 03 is built on two things you bring:
an investable universe and an objective.

TO DO.

Two deliverables, committed to your fork of the repo. Session 03 starts from them.

01 CHOOSE AN INVESTABLE UNIVERSE

The set of securities your idea could actually trade — the one you will download and curate in session 03.

- One asset class, one market — equities on one exchange is enough
- 30 to 100 names: enough to learn on, small enough to inspect
- A liquidity floor you can defend (average daily volume)
- Point-in-time: investable at the start of the window, not just today
- Ten years of daily history, or as far back as the names allow

02 WRITE YOUR OBJECTIVE

One paragraph that says what you are trying to find — written the way section 02 asked.

- The claim: one sentence, present tense, measurable
- Its source of edge: which of the five, and why it is still open
- The other side: who sells to you, and what keeps them doing it
- The test: what would settle it, chosen before you look
- The kill switch: the result that ends the idea

THE READING LIST.

All of it indexed in KaxaNuk-Research-Process — pull requests welcome if we missed one.
